Testimonials

"I used the Lab-Aid for to heat a wax sheet for a bite and it was perfect. I was thrilled with it. I think you have a winner here!"

Dr. Anne O'Donnell BDS NUI.
Denticloud, Wexford

"With Lab Aid we work more efficiently, have improved our work environment and process. This is a win-win situation for me and our laboratory. Better work for happier patients!"

Ashley Byrne
Byrnes Dental Laboratory

"We came across the Lab-Aid I and were impressed by its simplicity - it's a great way to soften dental wax! We were so impressed we bought a second one a week later as the running cost is very low"

Simon Miles DIP
Royal College of Surgeons (Eng)
Clinical Dental Technician
Smiles Centre

At Dental Lab-Aids, we are all about using proven engineering methods to solve process problems. That is why we have invented a new modern way to soften dental wax, making life easier and safer for Dentists and Dental technicians.

You'll enjoy the convenience of softening dental wax like never done before, as the unit does the work, without the need for your hands to touch the wax.

The structure of the wax is never compromised or degraded. Controlled softening ensures uniform rigidity when cold.

Latex gloves can be worn without the health and safety threat of a naked flame in your process.

Lab Aid I

The Lab Aid I product is a dual electric hotplate for softening dental wax, making it fit for purpose.

If left on throughout the working day it will ensure that soft wax is available at all times in advance of requirement.

Lab Aid I:

- Heats wax uniformly and hygienically making it fit for purpose.
- Cools uniformly and so is more rigid than flame softened wax.
- Low voltage unit: which uses only one unit of electricity in 40 hours of continuous use.
- As good as a third hand for the user as it is softening wax while other work is being done.
- Temperature of the large hotplate is accurately controlled.
- Can be adjusted to suit any dental wax on the market.

Lab Aid I Plus

Lab-Aid I Plus is a dual electric hotplate with an added induction coil heater.

Lab Aid I Plus:

- Prepares dental wax as per the Lab-Aid I.
- Induction coil heater heats dental instruments.
- Suitable for Dentists, technicians and dental students.
- Ideal for training colleges where a gas flame is no longer allowed.

"We have been using Lab-Aid for 12 months and it is now an integral part of our process.

We find that it is by far the best method of preparing dental wax for use. Dental equipment like this is very economical to run. We also use it for heating mirrors for intraoral photography."

Siobhan Murray BDS.
Blue Poppy Dental Practice, Donegal Town.

Lab Aid II

Lab-Aid II is a universal dental wax workstation.

Lab Aid II:

- Dual electric hotplates.
- Induction coil heater.
- Twin electric knives for intricate wax work.
- Wax rim reducer for reducing wax rim height on contact.
- Wax dipping pot.
- Alcohol bottle torch for fire polishing wax try-ins and bite blocks.
- Easily transported by technicians to dental surgeries for difficult cases.
- Ideal for use in training colleges where a naked flame is no longer allowed.
